

### SageCRM Enhancement: Mailchimp Email Deduplication scripts

If you try to push a group of emails from SageCRM to Mailchimp using the SEND TO MAILCHIMP button in SageCRM, and the list contains duplicate email addresses, the push to MailChimp will fail.

There are some situations where you may need to store the same email multiple times in your SageCRM database based on the setup of your customers. If you need to keep duplicate emails in your SageCRM database, we have a fix.

Effective Solutions has developed scripts and views in SageCRM to remove the duplicates from the group list before they are sent to Mailchimp, so you can store duplicate email addresses in SageCRM and still send the lists to Mailchimp.

The result is you will have a new Source View when you create Person based groups called "Mailchimp Person" like in the screen shot below. When you use this new source view, duplicate emails will be removed from the group list, and you will be able to SEND TO MAILCHIMP without getting the duplicate emails error.

The screenshot shows the 'Groups for: Person' interface in SageCRM. Under the 'Group Details' section, the 'Name' field contains 'Sample Person Group Dedupe'. The 'Type' dropdown is set to 'Dynamic Group', and the 'Entity' dropdown is set to 'Person'. The 'Available To' dropdown is set to 'All Users'. The 'Source View' dropdown is highlighted in yellow and set to 'Mailchimp Person'. There is also an empty 'Description' text area.

**Price to implement and walk you through building your first group with this new view is \$400.**
